

Bear Creek Services, LLC, provides multi-discipline engineering solutions

For more than a decade, Bear Creek Services, LLC, has been helping customers manage their wastewater disposal needs. In an evolving industry with technological changes always on the horizon, water management continues to be a significant cost issue, as well as a logistical hassle and an environmental liability for oil and gas companies throughout the country. As a company responsive to these issues, Bear Creek continues to work with developers to help match wastewater recycling and reclamation technologies with the client's specific needs. In fact, the company continues to explore alternatives to traditional salt-water injection well disposal methods.

Headquartered in Shreveport, with satellite locations in Colorado and Texas, Bear Creek was born in 2001 as an energy-conscious company tasked with well site engineering/drilling and supervision, environmental consulting, petrochemical services, transportation and wastewater disposal. Soon after commencing operations, Bear Creek's first venture involved the installation and maintenance of a commercial disposal well in northern Louisiana, followed by the subsequent development of a patented, mobile waste water processing system known as the Green Machine. The Green Machine proved to be a successful and economical method for effective reserve pit waste water reclamation, where waste water can be processed and transformed into a useable product. Today, full-scale, portable units are ready for commercial use, and field demonstrations are available by appointment.

Bear Creek's business also includes the oilfield services area, with a focus on oilfield science, research and technology. The company's growth spurred the creation of Emerald Surf Sciences, an off-shoot company dedicated to water recycling and reclamation services.

"Our business philosophy is that less is more, and science has shown that only a conservative amount of necessary chemicals are required for inclusion

into a project in order to get the job done,” said Scott Wilhite, Bear Creek’s Vice President of Business Development. “Ongoing research and the development of new technology and methodologies are areas that Bear Creek continually draws upon in our mission to find the best environmental business solutions for our customers.”
